

AST95

Anti-Slip Treatment For Ceramic Tile

Falls on slippery floors, decks or walkways are the leading cause of accidents in public areas. Fortunately, there is now a solution to this troubling problem. AST/95, is a remarkable new anti-slip treatment for hard floor materials such as ceramic tile, marble or stone. This two-step chemical process actually modifies the molecular structure of the floor material as it permanently bonds millions of abrasive silica crystals to the floor surface. The result is a dramatic improvement in slip resistance, even when the floor is wet.

As an anti-slip solution, AST/95 has attributes that set it far apart from other products such as acid etching, textured paints, coatings and matting. While each of these products has its place, AST/95 is the only anti-slip treatment which provides a substantial improvement in slip resistance without altering the appearance of the floor material. AST/95 treatments are not affected by sunlight or cleaning chemicals. The anti-slip surface is long lasting and virtually maintenance-free. The slip resistant texture becomes part of the floor itself, not a coating that can crack, chip or peel away.

AST/95 is used in many environments. Typical applications include ceramic tile decks around swimming pools or spas as well as showers, restrooms and locker room floors. AST/95 is also commonly installed on interior or exterior patios and malls, walkways, and entryways. If you have a smooth mineral floor surface that becomes slippery when wet, AST/95 is the solution.

AST95

- ▶ Patented, anti-slip chemical treatment.
- ▶ Perfect for ceramic tile, marble or stone.
- ▶ Reduces the risk of slips and falls.
- ▶ Improves traction in wet or dry conditions.
- ▶ Does not alter the floor's appearance
- ▶ Easy to maintain.
